

MTP® Cable Assembly Termination Tools

US Conec has released a family of low-cost array fiber holders designed specifically to aid in the process of terminating MTP® brand multi fiber connectors. Historically, ribbon holders designed for bare ribbon splicing have been used for the stripping and cleaving process of multi-fiber ribbon in preparation for termination to MT ferrule based connectors. US Conec's new family of array fiber holders facilitate more efficient MTP® cable termination to a variety of ribbon and loose fiber cable types, sizes, and fiber counts. Select models have a ribbonizing die built into the clip eliminating the need for a separate ribbonization process for loose fiber cables.
